Colts Neck Health Department

Verify Location of Septic System Components and Water Well(s)

Please be advised that the location of all septic system components (ie: septic tank(s): disposal field(s); seepage pit(s)etc and the location of the water well(s) must be identified on a survey or other equivalent document. Include distances from the proposed structure to the existing septic system components and water well.

This information is required for all proposed additions, decks, pools (both in-ground and above ground), sheds, cabanas, fences, retention walls, or any other structure that may potentially encroach/negatively impact the existing septic system or water well.

In addition, I understand it is the responsibility of the property owner and/or acting representative to ensure that all set back requirements from the septic system and water well are met.

Failure to provide the above requested information may delay the issuance of a permit for the proposed project.
